## INTRODUCTION

This bulletin contains the elevations of 756 lakes in the Prairie Provinces. It has not been feasible to adopt any definite rule as to what lakes should be included, but care has been taken in the selection so as to make the bulletin practically useful, and representative of the general water elevations in the various areas. The aim has been to include all lakes which are at least two square miles in area, if their elevations have been recorded, also some smaller lakes with known elevations if the lakes have local importance, and some very large lakes even though their elevations can only be estimated. The elevation of a particular lake may be of interest in itself alone, or it may afford an opportunity for supplying general information regarding the locality in which it occurs.

Lakes have several characteristics which make them a suitable means for supplying elevations. Over many large areas in the North they are almost the only definite features which can be identified by the simple use of a name, and they have everywhere a tangible existence which gives more reality to a recorded elevation than is the case when the elevation refers to some point on the ground, such as a section corner. The latter, even though its location is exactly stated, may yet have little meaning to many people. Lakes also are well suited for recording an elevation on a map owing to the ease of identifying the place, and also owing to the convenient space for figures afforded on most maps by lakes of even moderate size. Railway stations also afford these two characteristics—reference by name and ease of identification on a map—but the elevations of the great majority of stations have already been made known in various publications.

The authority for each lake elevation is shown by a reference number opposite to each. Numbers 1, 2, and 3, which together comprise eighty-two per cent of all the lakes in the bulletin, are direct records made by this Survey, the first having been ascertained while running regular lines of spirit levels, the second being derived from stadia work or aneroid readings based on neighbouring lines of levels, while the third, all of them in mountainous areas, are the results of trigonometric processes. These last include a few lakes recorded during the survey of the Alberta-British Columbia boundary. The three classes named include respectively 495, 91, and 30 elevations. The elevations in class number 4, which includes 36 lakes, are from the Dictionary of Altitudes by James White.

The class numbered 5 includes 82 lakes, all of which are of considerable size or of outstanding importance, but for which there is no definite record of elevation. The elevations in this class are estimated, but the estimates are based on a careful study of known water elevations in the vicinity which have a direct bearing on the elevation of the particular lake. The most satisfactory of such cases are those where an elevation has been recorded both on some stream which enters the lake and also on a stream which flows from it. Where there is no great difference in the elevations, or in the distances apart, of these two records, the elevation of the lake can be estimated with a sufficient degree of accuracy to be useful for many purposes. A few cases, all of them large and well known lakes, have also been included in this class although an elevation on only one side of the lake is at present available. In all cases occurring in class number 5, it is to be noted that nothing better than the estimated elevation is available.

The purpose of this bulletin is to supply general information regarding lake elevations in a convenient form for reference. While considerable care has been taken to have the elevations as correct as possible, it is not intended that they should be used by themselves alone for the purpose of laying out local works. Such enterprises generally call for a refinement which can only be properly secured by detailed levelling done with the special object kept prominently in view. The elevation of every lake varies to a slight extent according to the season of the year, and also from one year to another, and in very large lakes differences at opposite ends of the lake itself may be caused temporarily by strong winds. All elevations stated should be understood as giving the average elevation above mean sea level.

# TOPOGRAPHICAL SURVEY

## ELEVATIONS OF LAKES

The numbers following the names indicate the township, range, and meridian.

The authorities for the elevations are indicated as follows:

1. Topographical Survey, lines of spirit levels.
2. " " stadia or aneroid.
3. " " triangulation.
4. Dictionary of Altitudes, by James White.
5. Estimated elevations.
